## Preface

This volume of proceedings from the conference provides an opportunity for readers to engage with a selection of refereed papers that were presented during the International Conference on New Music Concepts, Inspired Education and New Computer Science Generation. The reader will sample here reports of research on topics ranging from a diverse set of disciplines, including mathematical models in music, computer science, learning and conceptual change; teaching strategies, e-learning and innovative learning, neuroscience, engineering and machine learning.

This conference intended to provide a platform for those researchers in music, education, computer science and educational technology to share experiences of effectively applying cutting-edge technologies to learning and to further spark brightening prospects. It is hoped that the findings of each work presented at the conference have enlightened relevant researchers or education practitioners to create more effective learning environments.

This year we received 57 papers from 19 countries worldwide. After a rigorous review process, 24 papers were accepted for presentation or poster display at the conference, yielding an acceptance rate of 42%. All the submissions were reviewed on the basis of their significance, novelty, technical quality, and practical impact.

The Conference featured three keynote speakers: Prof. **Giuditta Alessandrini** (Università degli Studi Roma TRE, Italy), Prof. **Renee Timmers** (The University of Sheffield, UK) and Prof. **Axel Roebel** (IRCAM Paris, France).

I would like to thank the Organizing Committee for their efforts and time spent to ensure the success of the conference. I would also like to express my gratitude to the program Committee members for their timely and helpful reviews. Last but not least, I would like to thank all the authors for their contribution in maintaining a high-quality conference and I hope in your continued support in playing a significant role in the Innovative Technologies and Learning community in the future.

March 2020

# Educational Design of Music and Technology Programs

Susan Lewis

School of Music, University of Victoria, Canada  
sglewis@uvic.ca

**Abstract.** Educational designers around the world have developed music and technology degrees of various types over the past 15 years; students have many options when selecting where and what to study. This is an outcome of strong industry interest in graduates trained in engineering and the arts, a growth in science/technology/engineering/arts/mathematics (STEAM) mindset, and student interest. Within this global ecosystem, music and technology programs have developed in different educational jurisdictions in an ad hoc fashion. The system is largely uncoordinated. There is ample room for collaboration and synergy to generate new opportunities for students. This paper surveys programs in music and technology at the undergraduate level to determine whether there are underlying commonalities among learning outcomes, and to identify future directions in programming. The first aim is to describe the learning outcomes associated with these degrees, then to compare them across different institutions. The results give educational and curriculum designers a broader context for designing new programs in music and technology and updating existing programs to stay current and relevant to students and industry.

**Keywords.** Educational design, learning outcomes, quality assurance, undergraduate degree, music and technology

## 1 Introduction

Educational designers around the world have developed music and technology degrees of various types over the past 15 years; students have many options when selecting where and what to study. This is an outcome of strong industry interest in graduates trained with skills in engineering and the arts, a growth in STEAM mindset, and strong interest from students who want to be industry ready upon graduation. Governments have responded with specialized funding, digital superclusters, and similar programs to support innovation in university education in arts and technology.

Within this global ecosystem, music and technology programs have developed in different educational jurisdictions in an ad hoc fashion. The system is largely uncoordinated. There is no single professional society or body that accredits the programs. There is great variety in web content promoting the programs, ranging from listings of courses,

testimonials from alumni, brief descriptions of programs, to more full-scale statements of learning outcomes and goals. There is ample room for collaboration and synergy to generate new opportunities for students.

The purpose of this paper is to survey programs in music and technology at the undergraduate level to determine whether there are underlying commonalities among learning outcomes, and to identify future directions in programming. The first aim is to describe the learning outcomes associated with these degrees, then to compare them across different institutions. The results of such research will give educational and curriculum designers a broader context for designing new programs in music and technology and updating existing programs to stay current and relevant to students and industry.

## **2 Educational Design and Undergraduate Music and Technology Degree Programs**

Adapted from the fields of engineering, architecture, and computer science, the design process for educational programs includes planning, development, implementation, and evaluation [1]. My paper takes as an assumption the need for music and technology programs (which yields the planning and development phase of educational design) and focuses on the implementation and evaluation of existing programs.

Music and technology degrees are offered under a range of titles. For the purpose of this study, I searched degree programs using the keywords: music and technology, music and computer science, music production, and music industry. The Audio Engineering Society (AES) maintains an online directory of educational institutions worldwide, yielding the most comprehensive inventory of programs and courses in music and technology. The online inventory is searchable by geographic region and program type, within seven categories: courses (that do not yield an accredited qualification or certificate), courses that yield an accredited qualification or certificate, associate degree courses, bachelors degree courses (e.g. Bachelor of Science [BSci], Bachelor of Arts [BA], Bachelor of Music [BMus]), masters degree courses (Master of Science [Msci], Master of Arts [MA], Master of Engineering [MEng]), research courses (e.g. Master of Philosophy [MPhil], Doctorate of Philosophy [PhD]), and other. While comprehensive, the inventory relies on entries generated (and updated) by institutions; many entries date back to 2011 without further update. Each entry includes basic information on location, program type, tuition, facilities, key contacts, and a link to the institution's web content.

As my own research has expanded from historical analysis of music to program design and development, there are three critical questions that should be asked of any new program: How will the program set up students for the future? (2) How will the new program leverage the department's research and creative practice? and (3) Will this program build in high impact, hands-on, minds-on learning opportunities for students? Music and technology programs have developed across the higher education system with little attention given to cross-system coordination and collaboration. This is surprising,

given the global market for music and technology. A goal of this study is to identify the potential for collaboration and system coordination at the undergraduate level so that students have more opportunities for learning in the global music and technology environment. To achieve this, I focused on bachelor degrees (type 4) and surveyed the inventory in the United States and the United Kingdom. From this survey, I isolated sixteen institutions (eleven in the United States and five in the United Kingdom); these institutions were selected for the more robust goal statements and learning outcomes (a requirement of programme specification in the United Kingdom) [2] and the longer history of programs. An environmental scan of all undergraduate music and technology degrees in North America, the United Kingdom, and Europe informed my understanding of overall programming trends.

### **3 Survey of Music and Technology Programs in North America and United Kingdom**

Appendix A, Overview of Features and Learning Outcomes for Undergraduate Degrees in Music and Technology [3, 4] consists of a concise summary of sixteen undergraduate degree programs in music and technology with information on the institution, goals of the program, learning outcomes, and special features.

There are three commonalities in programming that can be isolated among the degree programs at the sixteen institutions: (1) an emphasis on professional training and career readiness; (2) a focus on experiential, hands-on learning in the course delivery; and (3) collaboration among departments to offer the degree.

Websites geared to student recruitment emphasize the professional training and career preparation that students will get from the program. This is supported by course offerings in the business of music (noted at Oberlin Conservatory and New York University, Tisch) and learning opportunities such as capstone courses that connect students to industry leaders. The focus on training in a professional setting is stronger in music and technology programs than in other university-based degree offerings and may be linked to the presence of industry-engaged faculty members and instructors in these areas.

Experiential learning is a method and movement that is firmly established as a desirable and essential component of university education. Definitions of experiential learning are plentiful. They all incorporate some notion of hands-on or real-world learning (learning outside the classroom), a form of formal assessment, and an opportunity for students to reflect on their experiences. The Association for Experiential Education defines experiential learning as follows: “a philosophy that informs many methodologies in which educators purposefully engage with learners in direct experience and focused reflection in order to increase knowledge, develop skills, clarify values, and develop people’s capacity to contribute to their communities” [5]. For music and technology degrees, experiential learning takes the form of studio-based training, work with practitioners, and the production of recordings. Some programs feature specialized types of experiential learning opportunities such as internships or an Industrial Placement Year

(Goldsmith) and study abroad (featured at Keele University and the University of Liverpool).

Music and Technology degrees are offered as a collaboration by multiple departments: a school or department of music and a department in engineering. In larger arts-specific institutions, the collaboration may take shape across different areas of the same departmental structure. Combined programs leverage the research and creative practice of faculty members and introduce students to a wider spectrum of research than they might encounter in a single-unit degree program.

## 4 Conclusions and Future Directions

Music and technology is a growing industry with global reach. The survey and analysis of undergraduate programs in music and technology indicates that there are many quality programs with strong industry ties, a critical feature for programs geared to professional training and careers for graduates. As these programs get redesigned and updated in light of industry and educational innovations, there is benefit to greater cross-fertilization and collaboration across the system. This could take many forms, including increase in study abroad and student exchange programs and an increase in industry placements during the degree. As these forms of experiential learning are already embedded in individual degree offerings, this may entail an expansion of existing offerings alongside an effort to coordinate and communicate offerings across the system.

| <b>Degree offered</b>            | Bachelor of Music in Music Production and Engineering  |
| <b>Summary goal of program</b>   | The music production and engineering program prepares students to enter the current music production field as an effective professional in any number of roles within a landscape of rapidly evolving tools and techniques.  |
| <b>Learning/Program Outcomes</b> | Through in-studio classroom experience, hands-on project work, and exposure to resident and visiting industry professionals, students will: <ul style="list-style-type: none"> <li>• Develop an informed and critical aesthetic vision;</li> <li>• Gain a thorough knowledge and understanding of complex technical systems;</li> <li>• Learn to collaborate effectively with others in numerous musical settings through participation as an engineer and producer;</li> <li>• Learn to define quality using both musical and technical criteria, and to apply those criteria to your work and to the work of others;</li> <li>• Refine your communication and time-management skills in the context of multidisciplinary productions.</li> </ul> |
| <b>Special Features</b>          | Highly regarded program with an illustrious alumni, <a href="https://www.berklee.edu/notable-alumni-in-music">https://www.berklee.edu/notable-alumni-in-music</a><br><a href="https://www.berklee.edu/notable-alumni-in-music-production-engineering-field">https://www.berklee.edu/notable-alumni-in-music-production-engineering-field</a>   |

| <b>Degree offered</b> | Bachelor of Science in Music and Technology  |

|                                  |  |
|----------------------------------|--|
| <b>Summary goal of program</b>   | The goal of the core coursework in music and technology is to provide a comprehensive undergraduate understanding of all three areas of study: music, computer science and electrical engineering. Designed for students who want to pursue music technology as a career.  |
| <b>Learning/Program Outcomes</b> | Broadly: “Regardless of the entry point - an interest in computer science, electrical engineering, or music - the coursework prescribed will allow each student to gain the requisite knowledge and experience in all three areas.”  |
| <b>Special Features</b>          | <ul style="list-style-type: none"> <li>• Joint project between three of the schools: The School of Music, School of Computer Science, and the Department of Electrical and Computer Engineering.</li> <li>• Students will work closely with advisors and will be guided in both course selection and capstone projects.</li> </ul> |

|                                  |   |

| <b>Degree offered</b>            | Bachelor of Science<br>Associate of Science from the Audio Engineering and Sound Production Department established in 1982.   |
| <b>Summary goal of program</b>   | Intended for the student who wishes to pursue a career in music recording, radio, audio post-production for visual media, live sound, technical support, and Information Technology applications in audio. <ul style="list-style-type: none"> <li>• Over four years, students will spend over 1000 hours working in the studios.</li> <li>• Courses and lab project draw resources from the Jacobs School of Music</li> </ul> |
| <b>Learning/Program Outcomes</b> | Broadly: <ul style="list-style-type: none"> <li>• Students will have studio experience.</li> <li>• Students will get to record. They will experience from basic analog production to advanced DAW technique.</li> <li>• Some students will have the opportunity to collaborate with world-class faculty/producers and engineers.</li> </ul>   |
| <b>Special Features</b>          | The School’s record label IU Music has released over 50 discs.  |

|                                  |   |

| <b>Degree offered</b>            | Bachelor of Music in Music and Technology   |
| <b>Summary goal of program</b>   | Receive a solid foundation in music, music technology, and the liberal arts as you prepare for a career in fields like sound engineering, post-production, electronic music, software development, and multimedia.  |
| <b>Learning/Program Outcomes</b> | Broadly: “Upon graduation, students will be prepared for careers in fields like sound engineering, post-production, electronic music, software development, and multimedia. Thanks to an intensive education and important experiences working directly in the industry, you’ll be well positioned within a substantial network to take on a variety of roles, or pursue an advanced degree.” |
| <b>Special Features</b>          | Students “will have the opportunity to intern at major New York City recording studios, media companies, and performance venues such as Sony Music, Radio City Music Hall, Birdland, and the Metropolitan Opera. Internships have often led to permanent employment opportunities.”   |

|                                |  |

| <b>Institution</b>               | <b>New York University-Tisch School of the Arts</b><br><a href="https://tisch.nyu.edu/clive-davis-institute">https://tisch.nyu.edu/clive-davis-institute</a>   |
| <b>Degree offered</b>            | Bachelor of Fine Arts in Recorded Music from the Clive Davis Department of Recorded Music  |
| <b>Summary goal of program</b>   | The aim is to provide students with necessary skills – business, creative, and intellectual – so that they might emerge as visionary creative entrepreneurs in the evolving music industry. With a special emphasis on experiential education.   |
| <b>Learning/Program Outcomes</b> | Features business courses as they relate to the specialized needs of the contemporary music industry in tandem with a series of production and musicianship courses. Students are expected to become proficient in a range of popular music practices. Concurrently, students explore critical writing and music journalism, delving into the cultural impact of popular music and the history of contemporary musical genres. |
| <b>Special Features</b>          | Students will complete a “Capstone project”, a customized music business venture. They will have 5 minutes to present the project to a panel of music industry leaders.  |

|                                |  |

| <b>Institution</b>               | <b>Goldsmiths, University of London, UK</b><br><a href="https://www.gold.ac.uk/ug/bmus-bsc-electronic-music-computing/">https://www.gold.ac.uk/ug/bmus-bsc-electronic-music-computing/</a>  |
| <b>Degree offered</b>            | Bachelor of Music or Bachelor of Science in Electronic Music, Computing and Technology<br>3 years full time/4 years full time with the 3 <sup>rd</sup> year spent on a placement in a relevant industry/institution; 6 years part-time  |
| <b>Summary goal of program</b>   | The degree is designed to meet the opportunities, challenges and intellectual demands presented by careers in the arts and creative industries, in music technology and in audio,   |
| <b>Learning/Program Outcomes</b> | <p>Broadly:</p> <ul style="list-style-type: none"> <li>• Students will develop understanding across broad fields of creative practice, computer science and musical research.</li> <li>• Students will study with a wide range of academics, internationally established composers, performers, writers and computer experts.</li> <li>• Students will study in the departments of Music and Computing.</li> </ul> <p>Detailed learning outcomes are provided in the Programme Specification that includes knowledge and understanding, cognitive and thinking skills, subject specific skills and professional behaviours and attitudes, and transferable skills,</p> <p><a href="https://www.gold.ac.uk/media/docs/programme-specifications/bmus-bsc-electronic-music-computing-and-technology.pdf">https://www.gold.ac.uk/media/docs/programme-specifications/bmus-bsc-electronic-music-computing-and-technology.pdf</a></p> |
| <b>Special Features</b>          | The degree includes an optional Industrial Placement Year between the second and third year of study for students to develop practical skills and real-world experience with the support of a placement tutor, who provides students with guidance and liaises with employers.  |

This book presents a collection of selected papers that present the current variety of all aspect of the research at a high level, in the fields of music, education and computer science. The book meets the growing demand of practitioners, researchers, scientists, educators and students for a comprehensive introduction to key topics in these fields. The volume focuses on easy-to-understand examples and a guide to additional literature.

Michele Della Ventura, editor
